## Cazoodle Plunges into the Deep Web

 melrossmk June 22nd, 14:31

Cazoodle (<http://www.cazoodle.com>)

, a byproduct from University of IL ( renowned for engineering invention such as Mosaic, Netscape, PayPal and YouTube ), is consecrated to researching both the surface Web and the depths of the Deep Web ([http://en.wikipedia.org/wiki/Deep\\_web](http://en.wikipedia.org/wiki/Deep_web))

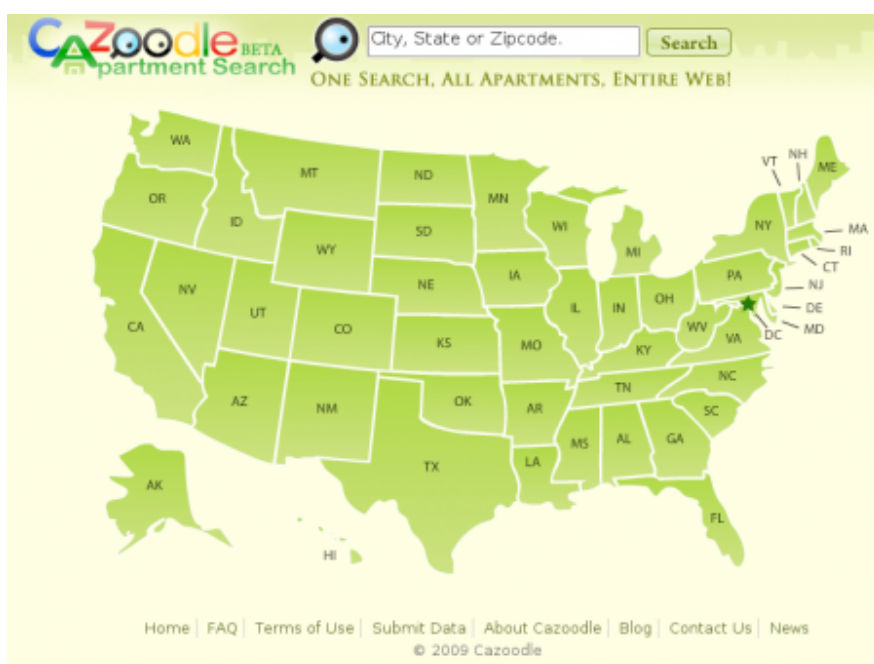

Utilise engineering developed in the research grouping of Prof Kevin Yangtze at UIUC, Cazoodle renders perpendicular hunting services,i.e. domain-specific hunting engines ( Flat Hunt, Event Hunting, Shopping Hunting ).

Similar to companies such as hokia (<http://www.hokia.com/>)

PowerSet (<http://www.powerset.com/>)

or ontoprise (<http://www.ontoprise.de/en/home/>)

( a by-product from Karlsruhe University ), Cazoodle leverages the big and turning sum of structured data within specific knowledge base. With Semantic hunt accross multiple Web origins, Cazoodle 's hunting engines enable immense coverage of available info. In combination with deep info desegregation these big data volumes can be researched through a clear interface. In point of fact, Cazoodle furnishes hunting consequences that are valuable because they can be compared in a consistent style. Pollexes up.
